Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

```
The sequence of the gene is carried on plasmid pCSF1-2 isolated from a CDNA library prepared from mRNA extracted from peripheral blood macrophages. The deduced protein sequence agrees with those determined for G-CSF from the human squamous cell line CHU-II and the human bladder cancer cell line 5637. The DNA can be used as a "master agne" for the construction of mutant genes which encode variants of hG-CSF which differ by at least one AA. See also AAP80963 and AAP80964, and AAP82874-92
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human granulocyte colony stimulating factor polypeptide derivs. - \hbar \epsilon at least one different aminoacid, giving high specific activity and

Other codons were chosen as those preferred for expression in E. coli. The gene was cloned into an expression plasmid for the prodn of G-CSF for use in the management of neuropaenia etc. See also AAR14224 (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptide prodn. by fermenting transformed host cells - in presence non-auxotrophic aminoacid to increase prod. accumulation, esp. for granulocyte colony stimulating factor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence is encoded by the synthetic gene AAQ28371. The plasmid containing the coding gene contains a novel inducible selection gene which is only expressed during the construction and testing phases of genetic manipulation. When the subsequent plasmid carrying the cloned gene is stably maintained in its bacterial host, the need for selection ceases. Cultures grown to express the cloned gene prod. will not require addn. of the selection drug and will not express the prod. of the selection gene. In this case the product of the cloned gene is human G-CSF which is used to treat neuropaenia associated with chemotherapy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              radiation therapy, or autologous bone marrow transplantation, to stimulate bone marrow suppression associated with AIDS, in the treatment of myelodysplastic syndromes characterised by gramulocyte functional abnormalities and as an adjunct to the treatment of severe infections. The sequence is that of human colony stimulating factor, which can be with an immunotherapeutic agent for cancer and an anticancer fung in a novel anticancer compsn. The compsn. has excellent anticancer effects, not shown by sole administration of the single components. It shows good life prolonging effects and has tumour growth inhibiting effects for mammalian cancers. It is esp. effective for treatment of early stage cancer and after cancer surgery. Treatable diseases include various kinds of sarcona, malignant lymphoma, malignant melanoma, malignant chlorionic tumour, phalia cancer, various kinds of digestive organ cancer, lung cancer, etc. See also AAR32258
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 LSSCPSQALQLAGGLSQLHSGLFLYQGLLGALEGISPELGPTLDTLQLDVADFATTIWQQ 120

This sequence represents a human granulocyte colony-stimulating factor-CSF) polypeptide. G-CSF is used in a powder preparation which is administered via the mucus membrane. The preparation comprises a polymeric medicine and a cationic polymer. The preparation is used for the mucosal administration of polymeric pharmaceuticals and has good absorption through the mucous membrane and improved bloavailability
                                                                                                                                                                                                                                                                                                                                                                                                                                                        TPLGPASSLPQSFLLKCLEQVRKIQGDGAALQEKLCATYKLCHPEELVLLGHSLGIPWAP

                                                                                                                                                                                                                                                                                                               An agent contg, human interleukin 11 (hIL-11), and pref. human granulocyte colony stimulating factor (hG-CSF), i.e. the present protein, can be administered in vivo to increase the prodn. of human peripheral blood (hPBS) cells. The agent may further exprise hIL-1, hIL-3, stem cell factor, leukaemia inhibitory factor, erythropoietin, GM-CSF and M-CSF, which synergistically increase hPBS cell prodn. The amt. of hIL-11 or hIL-11 plus hG-CSF is generally 0.001-100, preff 0.1-10 wt. %. The agent may contain a stabiliser (e.g. serum albumin) and fillers (mannitol). The dose is 0.1-1000 microg/kg/day, and the agent can be used in hPBS cell transplants for the treatment of blood system diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
(G-CSF)-responsive disease identical to hG-CSF.
                                                                                            colony stimulating factor (G-CSF). This protein is involved in the profile profile are and differentiation of gramulocytes in the blood. The sequence was used to create the proteins of the invention, which are designated gramulopoietic activity (GPA) proteins. These can be used instead of G-CSF, which has a short half-life in the blood and is unstable in storage, in treatments for neutropaenia associated with cancer therapies, radiation accidents, bone marrow transplantation, bone marrow suppression conditions such as ALDS, myelodysplastic syndromes characterised by granulocyte functional abnormalities, and severe infections. They can also be used to enhance peripheral blood progenitor
                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for the sustained-release of a biologically active agent (BAA), such as granulocyte-colony stimulating factor, comprises incorporating the BAA into a biocompatible polyol/oil
                                                                                 The present sequence is the protein sequence for the human granulocyte

A pharmaceutical composition comprising a biologically active agent (BAA) incorporated into a biocompatible polyol/oil suspension which contains a thickener is new. The compositions are used for the sustained-release of a BAA such as an incerferon consensus, EPO, granulocyte-colony stimulating factor, stem cell factor, leptin, tumor necrosis factor-binding protein, interleukin-1 receptor antagonist, brain derived neurotrophic factor, glial derived neurotrophic factor, metrophic factor, glial derived neurotrophic factor, neutrophic factor, stemprotegerin, granulocyte macrophage colony stimulating factor, thrombopoletin, or novel erythropoises; stimulating protein (claimed). The release of a medicament can be controlled to provide longer periods of consistent release that previous methods of treatment do not achieve, such as repeated injections. Blood levels of the active ingredient can be controlled, providing an enhanced prophylactic, therapeutic, or diagnostic effect as well as greater safety, patient convenience and patient compliance. The compositions can lead to dose sparing and a lower cost, in protection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LSSCPSQALQLAGCLSQLHSGLFLYQGLLQALEGISPELGPTLDTLQLDVADFATTIWQQ 120

                                                                                                                                                                                                                                                                                                                                                                          ઠ
                            The invention relates to an Escherichia coli producing and secreting human granulocyte colony stimulating factor (NG-CSF), more specifically, to a recombinant plasmid constructed to express secretory MG-CSF in E. coli, an E. coli transformed with that plasmid to secrete hG-CSF, and a process for preparing hG-CSF using the transformed hG-CSF. The combinant plasmid vector comprises of a kananycin resistance gene, a promoter, an endoxylanase signal sequence, a nucleotide sequence coding for an oliopeptide consisting of 13 amino acids including 6 consecutive histidine residues and a hG-CSF. E.coli transformed with recombinant plasmid vector is useful for preparing hG-CSF. The method comprises culturing the microorganism to obtain a hG-CSF fusion protein and treating the fusion protein with a protease preferably Factor Xa, to obtain a hG-CSF, where the fusion protein is obtained from the culture by employing Ni-column. The present sequence is human hG-CSF inserted into
                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                           120

                                                                                                                                                                                                                             The invention relates to a modified human granulocyte-colony stimulating factor (hd-CSF), characterized in that at least one of the first, second, third and seventeenth amino acids of wild-type hd-CSF (AAB61930) is replaced by other amino acids. The modified hd-CSF retains the biological activity of the wild-type protein. It does not have a methionine residue at the N-terminus and so can be efficiently expressed and secreted by a microorganism, when an appropriate secretory signal peptide is employed. The modified hd-CSF is useful for processes requiring hd-CSF. The present sequence represents the wild-type human hd-CSF mature protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

The invention provides a polypeptide (PP) conjugate (I) exhibiting granulocyte-colony stimulating factor (G-CSF) activity, comprising PP with a maino acid (as) sequence that differs from as sequence of human G-CSF by at least one as residue comprising an attachment group for a non-PP group bound to attachment of PP, and the PP group and having a non-PP group bound to attachment of PP, and the C-CSF by a trivity. (II) and (II) are useful for treating general hemotopoietic disorders, including care useful for therapeutic, disquestic disorders, including cidesorders arising from radiation therapy or from chemotherapy, AIDS or immunodeficiency diseases, leukopenia and bacterial or other infections. (II) is useful for therapeutic, disquestic and other purposes and in particular finds use as intermediate products for preparation of (I). (I) cand (II) are used for preventing infection in cancer patients undergoing radiation therapy, chemotherapy and bone marrow transplantations, to combilize progenitor calls for collection in peripheral blood progenitor cell transplantations and to support treatment of patients with acute myeloid leukemia. A nucleofies sequence encoding (II) is useful in gene therapy applications. (I) has increased functional in vivo half-life, increased serum half-life, reduced renal clearance, reduced receptor mediated clearance, reduced side effects, such as bone pain, reduced immunogenicity and/or increased bioavailability. The present sequence represents a mature hG-CSF with cooperation of the expression in E. coll: This is used in the construction of synthetic genes encoding hG-CSF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LSSCPSQALQLAGCLSQLHSGLFLYQGLLQALEGISPELGPTLDTLQLDVADFATTIWQQ 120

comprising at least one non-polypeptide moiety covalently attached to a polypeptide variant, wherein the amino acid sequence of the polypeptide variant that at least in corresponding wild-type human polypeptide in that at least I residue comprising an attachment group for the non-polypeptide group has been introduced and/or removed. The wild-type human polypeptide is selected from the group consisting of interferon-gamma (IFNG), interferon-beta, interferon alpha, follicle stimulating factor (G-CSP). The dispersion is used for the preparation of a medicament for pulmonary and/or circulatory administration. The present sequence is human wild type granulocyte colony stimulating factor (G-CSP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120
The invention describes remedies comprising a human granulocyte colonystimulating factor (G-CSF). Used for treating and preventing ischemic diseases such as external wounds, transplant rejection, ischaemic cerebrovascular disorders (e.g. cerebral apoplexy and cerebral infarction), ischaemic kidney diseases, ischaemic pulmonary diseases, ischaemic pulmonary diseases, ischaemic infarction), tachaemic cerebral infarction), ischaemic kidney diseases, ischaemic limb diseases, ischaemic heart disease (e.g. myocardial ischaemid, myocardial infarction or cardiac insufficiency) or arteriosclerosis. Agents may also be used for overcoming problems occurring particularly in the conventional kinesitherapy, pharmacotherapy and haemokinesis reconstruction for arteriosclerosis obliterans, gene therapy and intramuscular transplantation. This is the amino acid sequence of the human granulocytic colony-stimulating factor (G-CSF)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            09

Patent No. 5824784
GENERAL INFORMATION:
APPLICANT: Kinstler, Olaf B.
APPLICANT: Gabriel, Nancy E.
APPLICANT: Farrar, Christine E.
APPLICANT: DePrince, Nandolph B.
TITLE OF INVENTION: N-Terminally Chemically Modified Protein TITLE OF INVENTION: Composition and Methods
NUMBER OF SEQUENCES: 2
CORRESPONDENCE ADDRESS:
ADDRESSEE: Amgen Inc.

-!-FUNCTION: GRANULOCYTE/WARROPHAGE COLONY-STIMULATING FACTORS ARE
CYTOKINES THAT ACT IN HEMATOPOIESIS BY CONTROLLING THE PRODUCTION,
DIFFERENTATION, AND FUNCTION OF 2 RELATED WHITE CELL POPULATIONS
OF THE BLOOD, THE GRANULOCYTES AND THE MONOCYTES-MACROPHAGES. THIS
CSP INDUCES GRANULOCYTES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PHARMACEUTICAL: Available under the names Neupogen or Granulokine (Amgen/Roche) and Granocyte (Rhone-Poulenc). Used to treat neutroppinia (a disorder characterized by an extremely low number of neutrophils in blood).

SIMILARITY: Belongs to the IL-6 superfamily.

CAUTION: REP. 4 MISQUOTES THE GENE NAME AS "CSFI".

DATABAGE: NAME=Neupogen/Granulokine;

NOTE=Clinical information on Neupogen/Granulokine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           80
"Isolation, nucleotide sequence and expression of a cDNA encoding feline granulocyte colony-stimulating factor."; Cytokine 14:347-351 (2001).

-!- FUNCTION: GRANULOCYTE/MACROPHAGE COLONY-STIMULATING FACTORS ARE CYTOKINES THAT ACT IN HEMATOPOIESIS BY CONTROLLING THE PRODUCTION, DIFFERENTIATION, AND FUNCTION OF 2 RELATED WHITE CELL POPULATIONS OF THE BLOOD, THE GRANULOCYTES AND THE MONOCYTES-MACROPHAGES. THIS CSF INDUCES GRANULOCYTES (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: Screted.
-!- FUM: O-glycosylated (By similarity).
-!- SIMILARITY: Belongs to the IL-6 superfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21 TPLGPTSSLPQSFLLKCLEQVRKVQADGTALQERLCAAHKLCHPEELVLLGHALGIPQAP

"Crystal structure of canine and bovine granulocyte-colony stimulating factor (G-CSF).";

9. Mol. Biol. 234:640-653(1993).

1. FUNCTION: GRANULOCYTE/WACROPHAGE COLONY-STIMULATING FACTORS ARE CYTOKINES THAT ACT IN HEMATOPOIESTS BY CONTROLLING THE PRODUCTION, DIFFERRMITATION, AND FUNCTION OF 2 RELATED WHITE CELL POPULATIONS OF THE BLOOD, THE GRANULOCYTES AND THE MONOCYTES-MACROPHAGES. THIS CSF INDUCES GRANULOCYTES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PLGPASSLPQSFLLKCLEQVRKIQGDGAALQEKLCATYKLCHPEELVLLGHSLGIPWAPL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "Cloning and expression of equine interleukin-6.";
Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: IL-6 is a cytokine with a wide variety of biological
-!- FUNCTION: IL-6 is a cytokine with a wide variety of biological
functions: it plays an essential role in the final differentiation
of B-cells into Ig-secreting cells, it induces myeloma and
plasmacytoma growth, it induces nerve cells differentiation,
hepatocytes it induces acute phase reactants (By similarity).
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the IL-6 superfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2 PLGPASSLPQSFLL---KCLEQVRKIQGDGAALQEKLCATYKLCHPEELVLLGHSLGIP

Soc. Exp. Biol. Med. 204:301-305 (1993)
-!- FUNCTION: IL-6 is a cytokine with a wide variety of biological
-!- FUNCTION: IL-6 is a cytokine with a wide variety of biological
functions: it plays an essential role in the final differentiation
of B-cells into Ig-secreting cells, it induces myeloma and
plasmacytoma growth, it induces nerve cells differentiation, in
happrocytes it induces acute phase reactants.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the IL-6 superfamily.

-!- FUNCTION: Regulator of cell fate decisions in multiple lineages.
Specifically, functions as a determination factor that specifies sensory organ identity in precursor cells. Probably also involved in cell type specification of Malpighian tubules. In absence of cut gene external sensory organs are transformed into chordotonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE=88232956; PubMed=2897632;
